Summary

Full Stack Developer with 3+ years in production, currently leading a 15-developer team at Uncodemy. Comfortable owning a feature from database schema to deployed container. I've scaled a platform to 500K visitors, pushed 100K emails a day through a queue, and taken freelance clients from first call to live site on my own VPS. Java and Spring Boot on the backend, React on the front, AWS underneath.

Experience

Uncodemy

Lead Full Stack Web Developer Aug 2023 – Present, Noida, UP

Team Leadership

- Lead a team of **15+ developers**, owning sprint planning, code review, technical decisions and release sign-off across the company's product line.
- Mentor juniors on backend architecture and deployment practice, and act as the escalation point for production incidents.

Main Institute Website — uncodemy.com

- Own the company's primary revenue-driving website end to end, from feature work to on-call support, serving roughly **500K visitors**.
- Re-architected the hosting setup on **AWS EC2** with **CloudFront** caching, measurably reducing monthly infrastructure spend while improving load times.
- Replaced manual releases with a **GitHub Actions** pipeline into Dockerised containers behind **Nginx** — since reused as the deployment standard on every project below.

Internal Lead & Student Management Portal

- Built the company's internal operations portal on **Spring Boot** and **MySQL**, replacing scattered spreadsheets with one system the counselling, accounts and academic teams all work from.
- Covers the full student lifecycle: enquiry capture and lead assignment, registration, user and role management, batch and class attendance tracking, and a fee ledger showing paid, pending and overdue instalments per student.
- Wired the payment ledger into automated email — receipts on payment, scheduled reminders before instalments fall due — so follow-up no longer depends on someone remembering.
- Restricted financial records to accounts staff using **Spring Security** role hierarchies.

Certificate Portal — [link](#)

- Shipped a self-service portal generating and issuing course certificates on demand, cutting the admin team out of a repetitive request loop.

Online Compiler Platform — [link](#)

- Engineered a browser-based compiler executing **Java**, **JavaScript**, **Python** and **C++**, with isolated per-submission runtime containers.
- Solved the concurrency problem using a **Redis**-backed **BullMQ** queue, so heavy compile jobs run asynchronously instead of blocking the request thread.

Bulk Email & Notification System

- Scaled outbound delivery to roughly **100K emails per day** through **Amazon SES**, covering reminders, alerts and transactional mail.
- Tuned **25+ concurrent workers** with retry and backoff handling, keeping throughput high without tripping provider rate limits or bounce thresholds.

Learning Management System — In Progress

- Currently architecting the platform's LMS, modelling course, batch, student and administrative workflows in **MySQL** via **Spring Data JPA**, with live classroom updates over **WebSocket**.

Personal Projects

• **YouTube Clone** — *React, Redux, Axios* · [Vercel Live](#)

A video browsing interface with a responsive home feed, category filters, live search, and a watch page carrying the player, description and suggested-videos rail. Everything shared across routes — the active query, selected category, watch history and saved list — lives in a single **Redux** store with typed actions and reducers, so navigating away and back never loses context. Async fetches handle their own loading and error states.

• **Task Management Dashboard** — *React, React Router, REST API* · [Vercel Live](#)

A team board for moving work through stages: drag tasks between columns, set priority and due dates, assign owners and review activity history. State is lifted into a shared parent so the board, filters and summary panel stay in sync without a prop-drilling mess.

• **EduPath — Course Recommendation Platform** — *React, Java* · [Netlify Live](#)

Students browse subjects and get told what to learn next. The frontend was a deliberate exercise in React fundamentals: component composition, hooks for state and side effects, conditional and keyed list rendering, controlled form inputs and client-side routing. Recommendation logic sits in **Java** on the backend.

• **Gnest Academy Website** — *Freelance* · *VPS, Nginx, SSL* [Live](#)

A paid client engagement delivered solo, from the first requirements call through to handover. Covers course listings, database-backed enquiry forms and an admin panel the client updates themselves without touching code. I also handled the parts developers usually hand off — provisioning the **VPS**, configuring **Nginx**, pointing the domain's DNS and installing SSL.

Technical Skills

Front End: HTML5, CSS3, JavaScript, TypeScript, React.js, Redux, Bootstrap, Tailwind CSS.

Back End: Java, Node.js, Express.js.

Frameworks & ORM: Spring, Spring Boot, Spring MVC, Spring Security, Spring Data JPA, Hibernate, Spring Cloud.

AI Integration: OpenAI ChatGPT, Google Gemini, Anthropic Claude, Deepgram APIs.

Database: MySQL, MongoDB, PostgreSQL, AWS RDS, DynamoDB, MySQL Workbench.

Cloud & AWS: EC2, S3, CloudFront, Route 53, Lambda, Elastic Beanstalk, RDS, DynamoDB, VPC, Security Groups, CloudWatch, SES.

DevOps & CI/CD: Docker, Docker Compose, Kubernetes, Jenkins, GitHub Actions, Nginx.

Caching & Queues: Redis, BullMQ.

Hosting: Hostinger VPS, Vercel, Netlify, Render, Railway.

Domain & Security: GoDaddy, DNS configuration, SSL/TLS, HTTPS.

Awards

- **Best Employee Award** — for performance and project ownership in the workplace.
- **Appreciation Letter** — for leading the institute's core website launch.
- **Event Management Award** — for organising and running Technomeals.

Education

Bachelor of Computer Applications (BCA)

CGPA: 6.0/10

Relevant Coursework: Data Structures and Algorithms, Object-Oriented Programming, Database Management Systems, Operating Systems, Computer Networks, Software Engineering, Java Programming, Cloud Computing.
